13... OPTIMAL RECORDING POWER DETERMINATION CIRCUIT

(57) Abstract: There is provided an optical information recording/reproducing device capable of learning recording power for determining an optimal recording condition in which the recording power is not excessive and the waveform distortion is reduced. A recording power variable circuit (12) makes constant the ratio between the recording power Po at the front end and the rear end of the recording pattern for power learning which is received from a recording pattern generation circuit (5) and a recording power Pm at the The recording intermediate portion. powers Po and Pm are changeably set and data for learning recording power is recorded. When the data for learning recording power is reproduced, an allowable power range determination circuit (11) determines the allowable range of the recording power by setting an upper limit which is the recording power calculated by a power calculation circuit (8) by using a modulation degree detected from the reproduced signal and the allowable upper limit modulation degree and a lower limit which is the recording power calculated by an

allowable waveform distortion power calculation circuit (10) by using the waveform distortion amount detected from the reproduced signal and the allowable waveform distortion amount.

(57) 要約: 記録パワーが過大にならず波形歪みを低減した最適記録条件を決定できる記録パワー学習を行う光学的情報記録再生装置を提供する。記録パワー可変回路(12)が、記録パターン発生回路(5)から出力されるパワー学習用記録パターンの前端部および後端部での記録パワーPoと中間部での
